What does a security operations manager do

Security operations managers are also responsible for coordinating staff during emergency situations. Security Operations Manager Job Description Example What Does a Security Operations Manager Do? Security operations managers are responsible for directing the activities of security personnel to ensure protection of an organization's physical assets, properties, and resources. Their job description entails setting up security perimeter around a building or company premises to ensure the safety of employees and company facilities. Security operations managers develop and implement security policies and procedures necessary for protecting company assets against theft. They design and educate employees on emergency response action. They also implement safety regulations and procedures to minimize risk of workplace injury or death. As part of their duties, security operations managers assess incidents to lay down strategies that will reduce the likelihood of a future occurrence. They oversee the installation of safety alarms around building premises. They are also responsible for assigning guard duties to security personnel. Usually, security operations managers supervise the parking procedures in an organization to ensure an efficient parking system. Their work description also involves regulating entry and exit into a building by establishing building entrance and exit point. They also monitor individuals coming into a building with the aid of video surveillance. Security operations managers conduct drills to evaluate security responses. They oversee the installation of key controls on company equipment and property. Their role also includes recruiting, training, and supervising security officers. In fulfilling their role, security operations managers plan and coordinate security operations during special or high-risk events. They review and present reports to management on incidents and security breach. They also proffer recommendations on ways to avoid future breach in security. Security operations managers prepare and control budgets for security operations. They also review financial reports to ensure quality of security services. To successfully work in this industry, security operations managers require a high school diploma and experience as a security officer. Qualities needed for this job include organizational, communication, and interpersonal skills. Security Operations Manager Job Description Example/Template The job description example below shows the common tasks, duties, and responsibilities usually assigned to security operations managers in most firms: Recruit, orient, and train security personnel on appropriate security rules and procedures Develop and enforce security protocols, policies, and procedures necessary for safeguarding lives and property Prepare and control the budget for security operations to ensure delivery of high quality security services Oversee the coordination of staff during an emergency situation Assign guard duties to security personnel to ensure effective distribution of workload Keep track of incidents in order to evaluate them and recommend a course of action Oversee the installation of safety alarms within and around building premises Schedule shift patrol to ensure a building/property is guarded at all times Implement safety and health policies and procedures to protect employees against workplace hazard Develop and manage the processes for securing classified and sensitive information Set up key controls on company equipment and facility to limit access to restricted property Order the supply of security tools and equipment required in carrying out security operations Prepare and present reports of incidents and ways to limit reoccurrence Liaise with public law enforcement agencies and fire department Oversee the planning and coordination of security operations during high-risk events. Requirements - Skills, Abilities, and Knowledge - for Security Operations Manager Job Here are important requirements you need to meet for most employers to consider you for the job of security operations manager if you are interested in it. Education and Training: To become a security operations manager, you require a high school diploma and relevant experience in a law enforcement field. A Bachelor's degree in criminal justice, public administration, or in a related course is often required by some employers. Special training programs in senior security management provides a competitive edge in securing a security operations manager position Organizational Skill: Security operations managers are able to coordinate and direct the security operations of an organization to ensure the safety of lives and property Communication Skill: They are adept at communicating the security requirements of an organization to security personnel Interpersonal Skill: They are able to work with a team of security officers to ensure protection of a property To be hired into this position, you may be required to take and pass employment tests like personality test and situational judgment test. See job assessment tests you may likely take and learn how to make high scores in them. Conclusion This post provides exhaustive information of what security operations managers do. If you are interested in getting into this career, knowing what usually constitutes the job description of the role will help you in taking the right decision as to whether that is what you really want to do. Also, if you are an employer needing good security operations managers to hire, the sample work description provide above can be used as a template to follow in designing a work description for recruiting the best people for the position, and for allocating tasks to them. Did this post help you to learn much about what security operations manager do? Please make a comment about you take of this article in the box below, you may also share what you do as a security operations manager if you are one. Cristian Dina/Shutterstock Network security is the combination of policies and procedures implemented by a network administrator to avoid and keep track of unauthorized access, exploitation, modification or denial of the network and network resources. The primary purpose of network security is to prevent a network security attack which means any method, process, or means that can be used to attempt to compromise network security maliciously. Network security attacks can either be active or passive. Active attacks involve a network exploit in which an attacker attempts to change data transmitted to a specified target while a passive attack is unauthorized monitoring of a network system. How Does Network Security Work?A network security system combines multiple layers to address network security across an organization. The first layer enforces network security through a username/password mechanism allowing only authenticated users with customized privileges to access the network. When a user is granted access into the network system, the network policies are enforced by the network's configured firewall which restricts a user to particular services. The configuration software, however, cannot detect or prevent viruses and malware which is harmful to the network leading to loss of data. Antivirus software or an intrusion prevention system (IPS) is therefore integrated into the network security as the second layer to prevent viruses and other harmful malware from attacking the network.Access Control and Application Security Access control is a network security method that recognizes each user device enforced on security policy and helps keep out potential network attackers. It employs Network Access Control (NAC) to block noncompliant endpoint devices or limit their access. Application security is also important since any application may contain vulnerabilities that can be used by attackers to gain unauthorized access to the network. Application security includes the hardware, software and processes that are employed to limit these vulnerabilities. Behavioral analytics are tools used to monitor a network user's behavior to detect abnormal behavior. These tools automatically discern network activities that deviate from the norm. In turn they identify indicators of a potential network compromise and quickly remediate threats. Antivirus Software and FirewallsAntiviruses and firewalls are the most commonly known network security methods. Malicious software including viruses, worms, Trojans, ransomware and spyware are dangerous to network systems as they often lead to loss of data. Antivirus and antimlaware software detect malware upon entry and also analyze files afterward to establish anomalies, remove malware and fix the damage. Firewalls can either be hardware, software or both and function as a barrier between a trusted intornal network and an untrusted outside network such as the internet using a defined set of policies that can either allow or prevent traffic. Intrusion Prevention Systems and VPNs Intrusion Prevention Systems (IPS) are employed to block network attacks by actively scanning network traffic. These systems not only block malicious attacks but also continuously track suspicious files and malware that may have gained entry into the network to prevent the spread of outbreaks and reinfection. Virtual Private Networks (VPNs) allow communication between two systems. Data between these two points is encrypted, and users would need to authenticate themselves to enable communication between their devices and the network. Other network security types include Data loss prevention, email security, mobile device security, web security, security information, event management and wireless security.Benefits of Network SecurityWith almost every organization having an online presence, network security have to keep out malicious attacks that could compromise an organization's data. Only a few minutes of downtime is capable of causing widespread damage to an organization's operations. There are multiple methods, applications, tools and utilities companies and individuals can use to successfully secure their network systems, to prevent avoidable attacks and unnecessary downtime. Network security consists of several layers designed to implement policies and controls thus allowing only authorized users to gain access to network resources and at the same time block malicious attackers from gaining entry into the network.
